## Introduction

One of the most widely used web service today are web maps. Benefiting from the rapid advances in Information and Communication Technologies web maps offer a broad range of functionalities to lay and expert users to satisfy demands related to professional or personal life. But, for the growing range of map users, usage scenarios, and devices many application do not provide sufficient usability. The literature outlines that the GIScience research community still has too little knowledge on characteristics, needs, skills, and context of current web map users. This refers in particular to the development of web maps used in a cross-cultural context. However, it is widely acknowledged, that web pages with culturally relevant characteristics are more usable, and can increase user satisfaction and work efficiency.

Numerous of young researchers and doctoral students of Uzbekistan have been thinking about applying of GIS, Web GIS and programming in their research topics and field of studies. For implementation of those, mainly advanced knowledge of using software devices and computer technologies as well as theoretical and practical knowledge in the field of study are vital.

In this case, support of highly ranked foreign Higher Educational Institutions and qualification of their well-qualified teachers play crucial role. Erasmus+ “DSinGIS –Doctoral study in Geoinformatics” project has been giving good opportunity for doctoral students and young researchers of Uzbekistan in case of organizing 2 months scientific and practical training courses to improve their knowledge and skills in Geoinformatics.

So far, several researchers and doctoral students from partner HEIs of Uzbekistan have been improved their skills and qualification in their research topic and field of studies at European partner universities. Among them, me, PhD student of the Tashkent Institute of Architecture and Construction also have visited for two months (March 18-May 16) as a researcher to the Interfaculty Department of Geoinformatics – Z\_GIS, Salzburg University, Salzburg, Austria under supervision of Dr.Sabine Hannig on the topic of “Cultural-Centered Web Map Design: Background and Recommendation focusing on Uzbekistan”.

## Study Plan

Before the study visit to Salzburg University of Austria, Study plan had been applied with requested documents. Here, below study plan is given:

|         |  |
|---------|--|
| Week 1: | Learning literature and resources related to cross-cultural web mapping.   |
| Week 2: | Analyze different web map services (usability, characteristics, widgets...)  |
| Week 3: | Comparing German-speaking countries and Central Asian countries web maps.  |
| Week 4: | Collect data using crowdsourcing with a Survey123 form from community, Presentation at the host institution results of first month |
| Week 5: | Writing academic paper based on research   |
| Week 6: | Develop prototype web maps with cross-cultural usability   |
| Week 7: | Prepare recommendations to support developers in the implementation of cross-cultural web maps                                     |
| Week 8: | Finalize and present results of research, submit an academic paper for GISCA conference.   |

## Activities and Outputs of the stay

I worked with Mrs. Sabine during 2 month and spent most of my time in the office of Mrs. Sabine at NAWI. Attention was paid to literature review, IMRAD structure and research methodology.

The increasing number of web map users around the world is affecting for paying more attention by researchers to user-centred web maps design. Many recommendations have been developed to improve the usability and user experience of web map design. But often user-centred web maps design might not be enough. Meanwhile, today it is widely discussed in the context of web design the need to take also into account design preferences based on the cultural background of users.

***The User-Centered Design and Culture.*** Nowadays many researchers (Roth et al., 2015, Fuhrmann and Pike, 2005, MacEachren and Kraak, 2001, Petr, 2012, Hennig, 2017) recommend using the user-centered design for development of interactive maps. From (Norman and Draper, 1986) we know that the term of user – centered design was initially applied in the field of human-computer in 1980. And the user-centered design method concentrated on the usability of computer design, denoted to the requirements and preferences of users. Successful user-centered design begins from identification of target user groups or audience of interactive maps (Roth et al., 2015), enlargement of operativeness and effectiveness of the product is carried out by dynamically implicating of users at all steps of the design (Kahraman, 2010) and the core idea is to create a product for the end user (Petr, 2012). It's true that the user-centered design approach usually helps to save project resources if it applied in conceptual design stages or during prototyping (Krug, 2000) and it has to fulfill the conceptions of usability, user experience, and user-centricity (Atzl, 2015). But, on the other hand, (Reinecke, 2013) stressed the also importance of culture and stated that the user's pleasure and income from the product can rise by adjusting user interfaces to a user's cultural background. (Alostath et al., 2011) mentioned that in the globalization period culture plays a significant role in design usable products and becomes one of the most important factors. (Rimondi, 2015) outlined the path that leads from User-Centred Design to Culture-Centred Web Design and stated that Culture-Centred Web Design can be considered as a branch of User-Centred Design. (Stachon et al., 2018) stated that cultural aspects are only in few cases

becoming the focus of studies on current mapping products and as a consequence to get a better idea how cultures can influence web maps, designers often have to use experiences acquired in connected fields, like cross-cultural web design or cross-cultural psychology. To fill the gap in the lack of knowledge in Culture-Centered Web design, first, need to learn current experiences in the field of Web design and identify what kind of methods can be adapted for web map design.

***Culture in Web Design.*** Culture is a very complex and defined in many ways. Anthropologist Sir Edward B. Tylor (1924) stated that culture is “that complex whole which includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society”. Goodenough, (1971) defined culture like “A set of beliefs or standards, shared by a group of people, which help the individual decide what is, what can be, how to feel, what to do and how to go about doing it”.

Hofstede (1984) stated that culture is “the collective programming of the mind that distinguishes the members of one category of people from another”. Sheridan, (2003) stated that "Culture, in term of web globalisation, means how people from certain cultural orientations view and interpret specific images and messages". Hsiu Ching, (2008) after his investigation previous definitions defined culture as “the collective of specifiable signs, symbols, artefacts, values, behaviours, practices, conventions, beliefs, and norm which represent a cluster of people” and he mentioned that user`s culture influences the way of using web interfaces, because of dissimilar mental models they expect different symbols, colours, graphics, and layouts.

Conventional approaches to catering for culture are restricted to adaptations for specific countries and modify only a limited number of interface components, such as the language or date and time formats. (Reinecke, 2013) argues that a more comprehensive personalization of interfaces to cultural background is needed to appeal to users in expanding markets.

(Alostath et al., 2011) outlined the purpose of cross-cultural website design evaluation approach as identifying cultural differences at the user interface level and using these differences to generate new websites as prototypes that are more sensitive to culture and genre variability. And they stated that the Culture-

Centered Design method identifies the role of culture in the design of user interfaces.

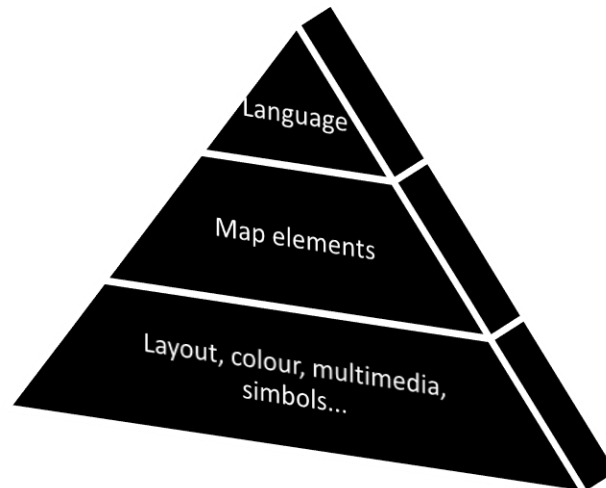

***Culture-Centered Design.*** Russo and Boor, since 1993, in one of the first articles on the importance of cultural aspects in the design of web interfaces, argued that cultural awareness is an aspect of user awareness.

Marcus and Gould (2000, p. 44), reiterated the importance of Culture-Centered Design on the web, stating that 'as the Web continues to develop globally [...] exploring, then exploiting, these dimensions of culture, will become a necessity and not an option for successful theory and practice'.

The goal of Culture-Centred Design is to assure that the user will not be offended or confused by the interface (Russo and Boor) addressing him not only in his own language but in the language of his culture, as far as pertains to information visualization and therefore using metaphors, mental models, navigation and interaction modalities adapted to the culture of the user. Sun, in 2001, stressed the importance of cultural awareness proposing to insert the "Cultural Sensitivity" next to effectiveness, satisfaction, efficiency of use as a metric of usability, considering culture as a semantic space in which action and meaning converge.

As demonstrated by Ito and Nakakoji (cited in Hillier, 2003), cultural factors are involved at every level of communication. It follows that designers will fit into their design numerous elements and norms pertaining to their culture, often in an unconscious way.

As pointed out by Choi, Lee, Kim (2006), according to the cultural iceberg model (Hoft, 1995), the visible characteristics of culture, such as language, represent only a small part (10%) of the cultural characteristics of a target audience. As applications and services are cultural amplifiers (Nakakoji 1996 cited in Choi, Lee, and Kim, 2006), a real localization must take into account 90% of the hidden cultural characteristics. It is therefore essential to bring out the effects of cultural characteristics on User Experience (Figure 1).

*Figure 1. Cultural iceberg modified to Web map design*

Based on previous researches in the field of culture-centered web design and user-centered web map design it becomes clear that cultural background plays a significant role in user experience. And if to take into account the fact that web maps are inherently embedded in a web page. It becomes clear that in order to create an aesthetically pleasing graphical interface of a web map, and a culture-centered Web map design it is necessary to take into account cultural markers in both web design and web map design (Figure 2).

*Figure 2. Culture-Centered Web Map Design*

Thus, for instance, the arrangement of menu or navigation elements in user interface design for one country is not really convenient to other countries who have differences in culture. In addition, the colours and symbols used in one culture can in some cases react to users either positively or negatively, because in most cases their meanings are different from each other. Accordingly, cultural differences increasingly have been taken into account in web design.

However, in the field of (web) cartography, there is still a lack of knowledge, regarding the culture-centered web map design. The question is, what can a culture-centered web map look like?

To answer this question several methods were applied: literature review and the analysis of existing web sites (governmental, news and media, education). Knowledge and information gained will help to elaborate recommendation of relevance in the context of a more culture-centered web map design for Uzbekistan, which can increase the usability and user experience of web maps for Uzbek users.

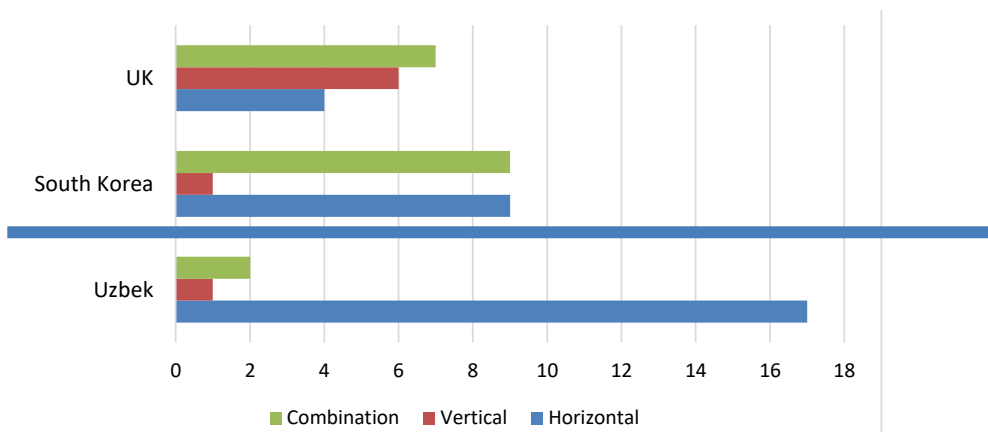

During analysis of websites, the focus was on such criteria as dominant colour, colour combinations, text positions and directions, use of images, languages, navigation, and visual elements (Table 1).

| <b>Web page characters</b> | <b>Criteria</b> |                    |
|----------------------------|-----------------|--------------------|
| Colour                     | Header          | Hex Code #         |
|                            | Background      | Hex Code #         |
|                            | Footer          | Hex Code #         |
|                            | Header Text     | Hex Code #         |
|                            | Body Text       | Hex Code #         |
|                            | Footer text     | Hex Code #         |
| Layout                     | Menu placement  | Vertical           |
|                            |                 | Horizontal         |
|                            |                 | Combination        |
|                            | Logo placement  | Left Top           |
|                            |                 | Middle Top         |
|                            |                 | Right Top          |
|                            | Image           | Top                |
|                            |                 | Left               |
|                            |                 | Right              |
| Middle                     |                 |                    |
| Bottom                     |                 |                    |
| Navigation                 | Menu            | Pop down           |
|                            |                 | Pop right          |
|                            |                 | Fixed              |
|                            | Links           | Type               |
|                            |                 | Number             |
| Search                     | Position        |                    |
| Multimedia                 | Text movement   | From top to bottom |
|                            |                 | From bottom to top |
|                            |                 | From right to left |
|                            |                 | From left to right |
|                            | Slide show      | Number of photo    |
| Text                       | Header Font     | Theme Fonts        |
|                            |                 | Size               |
|                            | Body Font       | Theme Fonts        |
|                            |                 | Size               |
|                            | Footer Font     | Theme Fonts        |
|                            |                 | Size               |

*Table 1. The Criteria list applied to selected Uzbek websites*

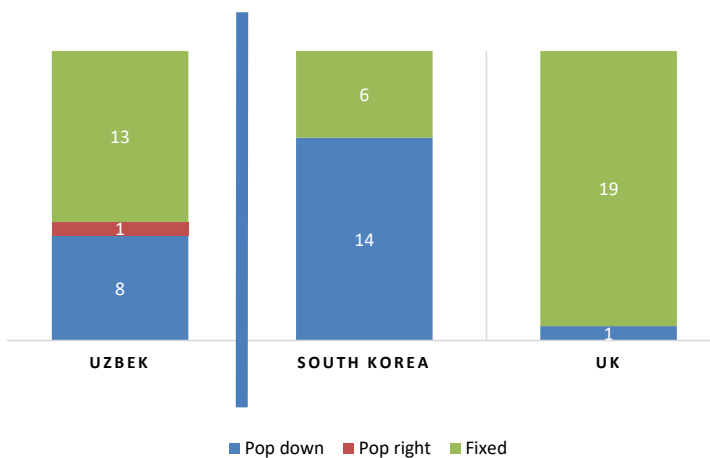

Here it becomes obvious that the Uzbek sites demonstrate clear preferences in terms of the use of certain colour combinations, types of pictures and the number of links used.

Cultural markers like Menu Placement, Menu type and colours were found by comparing our results with the results of research Juric et al., 2003. Graph 1 demonstrates the differences in menu placement between the UK, South Korea, and Uzbek websites. This result shows that Uzbek users are used to working with a horizontal menu more rather than vertical or combination.

*Figure 1. Compared Uzbek web sites Menu Placements with the research results of (Juric et al., 2003). 20 websites from each country.*

Fixed Menu type is more popular in the UK and Uzbek websites, but pop down menu more preferred in South Korea (Figure 2).

*Figure 2. Web Interface tendency.*

Cultural markers. Title and body text colours compared in Table 2.

| Colour     | Uzbek   | South Korea   | UK   |
|------------|---|---|--|
| Title text | Blue: 1<br>Cerulean: 1<br>Dark Jungle green: 3<br>Davy grey: 1<br>Dodger blue: 1<br>Lapis Lazuli: 2<br>Teal blue: 1<br>White: 7<br>Zinnwaldite brown: 1 | Blue: 5<br>Black: 10<br>Grey: 2<br>Green: 1<br>Red: 1       | Black: 8<br>Blue:6<br>White:3<br>Yellow: 1 |
| Body text  | Black: 4<br>Dark Jungle green: 3<br>Dark Lava:4<br>Davy grey:4<br>Dim Gray: 3<br>Rifle green: 1<br>Saint Patrick Blue: 1                                | Black: 5<br>Dark grey: 1<br>Grey:2<br>Green: 1<br>Orange: 1 | Black: 10<br>White:3<br>Blue: 1            |

*Table 2. The colour types of typography in the selected Uzbek websites, compared with the results of Juric et al., 2003*

Table 3, demonstrates the preferred colours which were used for headers, backgrounds, and footers in Uzbek websites. Based on the popularity and attendance of web sites, it can be assumed that these colours are more convenient for perceptions of Uzbek users. If to pay attention to the pattern of use of colours in these web sites, it turns out that different types of blue and grey are often used in the header and footer.

|                   |  |
|-------------------|--|
| Header Colors     |  |
| Background Colors |  |
| Footer Colors     |  |

*Table 3. The colour palette in the selected Uzbek websites*

Knowledge and information gained will help to elaborate recommendation of relevance in the context of a more culture-centered web map design for

Uzbekistan. This can increase the usability and user experience of Uzbek web maps users. This might also be useful for developers of web maps not only in Uzbekistan but also in other Central Asian countries.

After presentation at “Selected topics” class, we started working on the paper oriented to the GISCA 2019.

*Photo 3. Preliminary agenda of the GIS in Central Asia Conference – GISCA 2019*

After accomplishing the 2 months training in Salzburg and arriving to Uzbekistan, I went to Bishkek from May 30- June 1, 2019 to demonstrate our result to the GIS community and participated in the GISCA 2019.

*Photo 4-5. Participation in the GISCA 2019, Bishkek.*

Also during training in Salzburg University with help of my supervisor Dr. Sabine Hannig I prepared the poster for the GI-Forum 2019 and July 2-3 participated at the Forum.

**Culture-centered web map design: background and recommendation focusing on Uzbekistan**  
 Otabek Avezbaev  
 Department of Geodesy and Cadastre - Tashkent Institute of Architecture and Construction, Navoi Street 13, Tashkent, Uzbekistan, E-mail: otাবেক.avezbaev@gmail.com

**Introduction**

The increasing number of web maps around the world is attracting for many attention by researchers to user-centered web map design. Many recommendations have been developed to improve the usability and user experience of web map design. But often user-centered web map design might not be enough. Meanwhile, culture is a widely discussed in the context of web design the need to take into account design preferences based on the cultural background of users.

Thus, to increase the engagement of users or navigation elements to user interface design for one country is not really convenient to other countries who have differences in culture. Although cultural differences increasingly have been taken into account in web design, but in the field of web cartography, there is still a lack of knowledge regarding the culture-centered web map design.

The key questions are: What are a culture-centered web map look like? And which recommendations can be made for the design of culture-centered web map?

**Background**

The User-Centered Design and Culture

The user-centered design method concentrates on the usability of computer design oriented to the requirements and preferences of users [1]. It is true that the user-centered design approach usually helps to save project resources if applied in conceptual design stages in during prototyping [2] and it has to fulfil the requirements of usability, user experience, and usability [3].

But, on the other hand, the user's pleasure and income from the product can rise by adjusting user experience to user's culture background [4].

In the globalized present culture plays a significant role in design creative products and increasing user satisfaction. The user-centered design approach is not enough to create products and as a consequence to get a better idea how cultures can influence user experience other than to use requirements adapted in conceptual fields, the user culture web design or cross-cultural psychology [5].

To be the goal in the lack of knowledge in Culture-Centered Web Design, this need to learn current experiences in the field of Web design and identify what kind of methods can be adapted for web map design.

**Culture Web Design**

Culture is a very complex and defined in many ways. Culture is:

- The collective programming of the mind that distinguishes the members of one category of people from another [6].
- The collection of identifiable signs, symbols, artifacts, values, behaviors, practices, conventions, beliefs, and norms which represent a cluster of people [7].
- User culture influences the way of using and interaction, because of different mental models they expect different symbols, colors, graphics, and layouts.

**Culture-Centered Design**

The goal of Culture-Centered Design is to ensure that the user will not be affected or confused by the interface [8] addressing this user and its user language but in the culture of the culture, as far as possible to information visualization and therefore using metaphors, mental models, navigational and interaction modalities adapted to the culture of the user.

The importance of cultural decisions regarding to insert the "Cultural Sensitivity" used to effectiveness, satisfaction, efficiency of use as a metric of usability, involving culture as a semantic space in which color and meaning converge [9].

According to the culture coloring model [10], the design color preferences are different in different languages, represent only a small part (30%) of the culture information. In addition, each application and services are cultural artifacts, a user interaction must take into account 90% of the human culture characteristics [11].

It is therefore essential to bring into the effects of cultural characteristics on User Experience (Figure 1).

**Methods**

Analysis of local websites: 20 local Uzbek websites analyzed according to criteria list:

- Identification of their interface tendency and information design at a cultural level.
- Cultural Market Approach: aims to use the local website analysis to identify culturally preferred characteristics to transfer the website design at a cultural level. The approach needs to identify the interface design features that are preferred by specific cultural audiences or most prevalent in the specific culture group.
- After the selection process, data collection began where each website design characteristics (visual representation, color, layout, navigation, multimedia, language, etc.) are identified on one website and then analyzed based on the criteria list.
- Data about the menu placement, image, multimedia, text, and language were collected.
- Semi-structured script of the collection aims used for color and font elements. **CultureFit** Empirical design aims used to identify the color of culture (background, color and font colors) and **Culture Space** design aim used for comparing this data into the name of the color. **WebFit** design was used to identify fonts on web design.

**Acknowledgments**

The research was supported by Uzbekistan Ministry of Education, Science and Innovation Development. The author is grateful to Sabine Hannig for her support and assistance in the preparation of this manuscript.

## Conclusions and future plans

Erasmus+ “DSinGIS –Doctoral study in Geoinformatics” project has been giving good opportunity for doctoral students and young researchers of Uzbekistan in case of organizing 2 months scientific and practical training courses to improve their knowledge and skills in Web GIS and programming.

I had a great chance to visit to one of the highly ranked the Geoinformatics Z\_GIS department at the Paris Lodron University of Salzburg, Austria.

I strongly believe that this research has the potential to contribute to the scientific understanding of web maps in Uzbekistan, but even more, it may impact wider society and decision maker sector as well. In the future based on the use of the user-culture-centered design and usability engineering methods I will identify and analyze design elements and characteristics relevant for creating web maps that can be used more efficiently throughout the world. And I am going to continue my PhD, and work on the topic – *“Creation of an enterprise geographic information system (GIS) based on open source tools for organizing the efficient use of land resources”* where the part of web mapping and UI design will be developed according to my knowledge which I got during my training in PLUS.

## Acknowledgements

I gratefully acknowledge for great opportunity and financial support by Erasmus + “DSinGIS – Doctoral Studies in Geoinformatics” project, DSinGIS project coordinators Dr Lorant Foldvary and Ilhom Abdurahmanov, professor Markus Bela project manager – Mamanbek Reimov, Supervisor from Paris Lodron University of Salzburg - Dr. Sabine Hennig, as well as Prof. Josef Strobl and international relations department of PLUS and TIAC for moral and technical support before and during my study visit in Salzburg, Austria.
